

ABSTRACT

An information processing apparatus and process for dealing with moving pictures. A storage stores still pictures corresponding to scene switchovers of the moving pictures, and time stamps of the scene switchovers. A display controller provides a display control to display, given a reference position on the screen, the still pictures in positions at distances from the reference position. Those distances reflect differences between a time stamp corresponding to the reference position and the time stamp of the scene switchovers.

ABSTRACT OF THE DISCLOSURE

This invention relates to an information processing apparatus for recording a first picture supplied and for reproducing a second picture recorded, the apparatus comprising: recording means for recording the first picture; reproducing means for reproducing the second picture; and display controlling means for providing display control in such a manner as to display a first screen through which to input orders for operating the recording means, and a second screen through which to input orders for operating the reproducing means.
